TITLE: The Theory of Free Finite Oscillations of the Interface
Between Two Unbounded Heavy Liquids of Various Densities

PERIODICAL: Doklady Akademii nauk SSSR, 1961, Vol. 136, No. 1, pp. 51-54

TEXT: The plane motion of an unbounded ideal incompressible liquid consisting of two layers, one above the other, of various density is investigated. Using the coordinates $x_i(a_i, b, t)$ and $y_i(a_i, b, t)$ of the individual particle and the function $Q_i(a_i, b, t) = -p_i(a_i, b, t)/\rho_i g y_i$, where g is the acceleration and a, b are Lagrange variables, standing waves with small amplitude are investigated, which differ only little from oscillations of the linear theory. New variables $x_i = a_i + \epsilon f_i$, $y_i = b + \epsilon \gamma_i + \epsilon \gamma'_i$, $f_i = \epsilon \gamma_i$ and $Q_i = \epsilon q_i$ ($i = 1, 2$), where ϵ is a small parameter, are introduced. Thus, the following equations are found from the equations of hydrodynamics:

The Theory of Free Finite Oscillations of
the Interface Between Two Unbounded Heavy
Liquids of Various Densities

$$\begin{aligned}\frac{\partial^2 \xi_i}{\partial t^2} + \epsilon \left[\frac{\partial^2 \xi_i}{\partial t^2} \frac{\partial \xi_i}{\partial a_i} + \frac{\partial^2 \eta_i}{\partial t^2} \frac{\partial (\eta_i + \gamma_i)}{\partial a_i} \right] &= \frac{\partial q_i}{\partial a_i}, \\ \frac{\partial^2 \eta_i}{\partial t^2} + \epsilon \left[\frac{\partial^2 \xi_i}{\partial t^2} \frac{\partial \xi_i}{\partial b} + \frac{\partial^2 \eta_i}{\partial t^2} \frac{\partial (\eta_i + \gamma_i)}{\partial b} \right] &= \frac{\partial q_i}{\partial b}, \\ \frac{\partial \xi_i}{\partial a_i} + \frac{\partial \eta_i}{\partial b} &= -\epsilon \left[\frac{\partial \xi_i}{\partial a_i} \frac{\partial (\eta_i + \gamma_i)}{\partial b} - \frac{\partial \xi_i}{\partial b} \frac{\partial (\eta_i + \gamma_i)}{\partial a_i} \right].\end{aligned}\tag{7}$$

Determination of the functions q_i , ξ_i , η_i , μ , ν ($i = 1, 2$) and the constant $K = K(\sigma, \epsilon)$ is carried out so that the boundary conditions (11), (12) and (13) are satisfied:

$$a_1 + \epsilon \xi_1(a_1, 0, t, \epsilon) = a, \quad a_2 + \epsilon \xi_2(a_2, 0, t, \epsilon) = a; \tag{11}$$

$$\eta_1(a_1, 0, t, \epsilon) + \gamma_1(a_1, 0, \epsilon) = \eta_2(a_2, 0, t, \epsilon) + \gamma_2(a_2, 0, \epsilon); \tag{12}$$

$$\begin{aligned}\rho_1\{q_1(a_1, 0, t, \epsilon) + g[\gamma_1(a_1, 0, \epsilon) + \eta_1(a_1, 0, t, \epsilon)]\} &= \\ = \rho_2\{q_2(a_2, 0, t, \epsilon) + g[\gamma_2(a_2, 0, \epsilon) + \eta_2(a_2, 0, t, \epsilon)]\}.\end{aligned}\tag{13}$$

The required functions are assumed to be periodic with respect to a_1 , a_2 and a , with the period $L = 2\pi/K$ and periodic with respect to t , with the

Card 2/4

The Theory of Free Finite Oscillations of
 the Interface Between Two Unbounded Heavy
 Liquids of Various Densities

period $T = 2\pi/\sigma$. The solutions for $\zeta = 0$ are assumed to correspond to the solutions of the linear theory. The velocities of the liquids in every layer are assumed to be potential velocities, and the solutions must be standing waves. The solutions are found in successive approximation as series with respect to powers of ϵ . In third approximation, the author obtains the following results:

$$K = \frac{\sigma^2 (\rho_2 + \rho_1)}{\rho (\rho_2 - \rho_1)} + \epsilon^2 \frac{\sigma^4}{4g^3} \frac{(\rho_2 + \rho_1)(\rho_2^2 + \rho_1^2)}{(\rho_2 - \rho_1)^3} \quad (\zeta = \epsilon \frac{D_{10}}{g} \frac{(\rho_2 + \rho_1)}{(\rho_2 - \rho_1)}) \quad (17)$$

For the interface of the two media a voluminous expression is given, which is then analyzed. It is shown that no unmoved nodes of the standing waves exist: a relation is given for the motion of these nodes. Furthermore, the coordinates of the oscillation-antinodes are given. The particles on the interfaces of the two media move along this boundary but in opposite directions. There are 3 Soviet references.

TITLE: The theory of steady-state capillary-gravitational waves of finite magnitude on the surface of a fluid over an undulating bottom

SOURCE: International Symposium on Applications of the Theory of Functions in Continuum Mechanics. Tiflis, 1963. Prilozheniya teorii funktsiy v mekhanike sploshnoy sredy. t. 2: Mekhanika zhidkosti i gaza, matematicheskiye metody (Applications of the theory of functions in continuum mechanics, v. 2: Fluid and gas mechanics, mathematical methods); trudy simpoziuma. Moscow, Izd-vo Nauka, 1965, 362-381

TOPIC TAGS: gravitation wave, ideal fluid, incompressible fluid, fluid surface

ABSTRACT: The author investigates steady-state plane capillary-gravitational waves on the surface of an ideal incompressible fluid over a bottom bounded by a periodic undulating plane curve. Conditions prescribed in an earlier work are presented. It is assumed that the undulating line of the bottom is symmetrical relative to the verticals at its crests and troughs. A determination is made on the free surface of waves which are symmetrical in relation to the same straight lines as the line of the

Card 1/2

ACC NR: AT6016797

bottom. The solution is constructed in the form of dimensionless small parameter power series, proportional to the small amplitude of the undulating line of the bottom. A method is presented for the construction of these power series, and the first three approximations are calculated to the end. The convergence of the series for sufficiently small values of the parameter is proved by the method of majorants, which generalize the Stokes majorant; this problem, however, will be treated in a separate article. It is noted in conclusion that it is possible to prove the presence of a surface flow in the wave flow described by determining the interval of time during which a particle travels along its line of current between the verticals of two sequential wave crests. TITLE: On non-oxidizing heat treatment of a 1X18H9T (1Kh18N9T) steel strip using electric preheating

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 2, 1963, 121, abstract 2I693 ("Sb. tr. Mosk. vech. metallurg. in-ta", 1962, no. 4, 65 - 73)

TEXT: The authors established techniques for the non-oxidizing heat treatment of a 1Kh18N9T steel strip (excluding etching). It is recommended to preheat the strip for quenching (to 1,150 - 1,170°C) during 5 - 10 minutes in a muffle inductor with a transverse magnetic field in shielding atmosphere (argon) and to conduct subsequent quenching in a non-oxidizing atmosphere. Non-oxidizing heat treatment yields on the surface a very thin and dense passivating film, excludes metal loss during the formation of scale and etching. The use of non-oxidizing heat treatment with high-speed electric heating makes it possible to produce highly efficient automated continuous cold-rolling-heat treatment-lines. The economical profit of non-oxidizing heat treatment of the strip is confirmed by approximate technical and economical indices.

AUTHORS: Lendyel', B., Sekey, T. and Chuppon, A.

TITLE: On the hydrolysis and polycondensation of the methyl chlorosilane

SOURCE: Khimiya i prakticheskoye primeneniye kremneorganicheskikh soyedineniy; trudy konferentsii. no. 6: Doklady, diskussii, resjeniye. II Vses. konfer. po khimii i prakt. prim. kremneorg. soyed., Len. 1958. Leningrad, Izd-vo AN SSSR, 1961, 184-194

TEXT: The object of the work was to investigate the system of methyl siloxanes with a high average functionality and to find a quantitatively measurable property of the hydrolysate depending on the hydrolysis parameters. It was thus desired to establish the dependence of the product properties on the conditions of hydrolysis. The hydrolysis was conducted in butyl acetate saturated with water. For the gel-forming systems, the fraction of polysiloxane which gels was determined by changing the composition of the hydrolysing

medium. For the systems in which there was no gelation the first portion of polysiloxane formed was examined in relation to the conditions of hydrolysis. Diffusion constant measurements were used for characterizing average degree of the polymerization, using dry butyl acetate as a solvent. The method of moments was used for calculating the diffusion constants on the basis of

$$\frac{x_2}{2\beta^2 M_0 t} = \frac{1}{c_1 - c_2} \quad \left. \begin{array}{l} c_1 \\ c_2 \end{array} \right\} Ddc = \bar{D}$$

where M_0 is the zero moment, M_2 - the moment of the second order, t - time in seconds, c - concentration and β a constant equal to 10^2 . It was found that \bar{D} increases in an alkaline or buffered me-

Card 2/3

dium. The presence of certain cations, in particular Mg^{++} , during hydrolysis showed the same action as the increase in pH. D in all concentration regions investigated decreased if pH of the hydrolyzing medium (distilled water) had a lower value than that of the Na_3PO_4 solution used. The authors concluded that in the presence of Mg^{++} the increasing pH during hydrolysis is connected with the increasing diffusion constants or the mean diffusion constants of the primary hydrolysate. A decrease of the mean molecular weight of methyl siloxanes with increasing pH and the accompanying low, weak tendency towards gel formation in $SiCl_4 - (CH_3)_2SiCl_2$ systems indicated clearly the decreasing degree of polydispersion which favored the condensation. A discussion followed in which N. N. Sokolov (VEI, Moscow), N. S. Leznov (Moscow) and K. A. Andrianov took part. There are 4 figures and 3 tables.

TITLE: Structure and thermal degradation of cyclic and linear polymers of dimethylsilylene and dimethylgermylene

SOURCE: AN SSSR. Doklady, v. 164, no. 4, 1965, 822-825

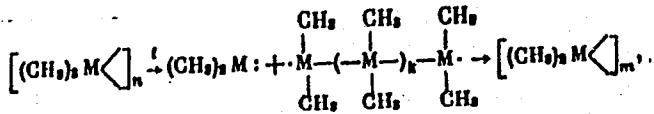

TOPIC TAGS: organosilicon compound, organogermanium compound, pyrolysis

ABSTRACT: An IR, NMR, and mass-spectrometric study of the soluble part of the products resulting from the reaction of $(\text{CH}_3)_2\text{SiCl}_2$ with lithium in tetrahydrofuran showed that it consists mainly (95-97%) of crystals melting at 228-231°C and forming the cyclic polymer $[(\text{CH}_3)_2\text{Si}]_6$. Similarly, a mass-spectrometric analysis confirmed that the germanium polymer, melting at 207-209°C, also forms the cyclohexamer $[(\text{CH}_3)_2\text{Ge}]_6$. Pyrolysis of dimethylsilylene and dimethylgermylene at moderate temperatures (up to 350-400°C) leads mainly to the rupture of M-M bonds to the formation of monomeric, dimeric, and polymeric biradicals:

Card 1/2

L 10873-66

ACC NR: AP5025864

9

where M = Si or Ge; k = 0-4 or more; m=3(?), 4-6 and more. In the absence of special acceptors, these biradicals recombine chiefly with one another, forming the cyclic polymers $\left[(\text{CH}_3)_2 \text{M} \right]_m$. The data obtained indicate that pyrolysis of the polymers $\left[(\text{CH}_3)_2 \text{M} \right]_n$, where M = Si, Ge, Sn, or Pb, can be used as a general method of generating the corresponding carbenoids $(\text{CH}_3)_2 \text{M} :$. The paper was presented by B. A. Kazanskiy, Member of AN SSSR, 26 Mar 65. Authors thank M.⁴⁴ I.⁵⁵ Gorfinkel', A. S. Khachaturov, and L.⁴⁴ A.⁵⁵ Leytes for carrying out the spectroscopic determinations.

law. Specializes in observation of faint objects. A number of stations are making photographic artificial satellite observations. The photographs are taken at Prague with cameras with a Gekistar objective (1:3.5, F = 15 cm). Accuracy of determination of position is 0'.1 and accuracy of time determination 0".052. In 1962 a camera with a Telekon objective (1:6.3, F = 75 cm) was used. Observations were processed on a high-speed computer by the Ceplecha method, modified for systems with a long focal length. Measures are being taken to increase the accuracy of time recording. Photographic artificial satellite observations also have been made at the Astronomical Institute of Brno University in 1957-1958 and 1960. Systematic photographic observations are being made at Skalnate Pleso station. The main objective of Czechoslovakian stations at the present time is increasing the accuracy of observations and introducing such photographic methods as will make it possible to determine time with an accuracy to several milliseconds. The greatest successes have been attained by the Prague station, which is engaged in photographing faint artificial earth satellites using a camera with a film holder and a moving film. V. Novopashenny.

TOPIC TAGS: artificial satellite, satellite tracking / AT-1 telescope, Wilde T-2 theodolite, Gekistar objective, Rifler clock, AFP aerial camera

ABSTRACT: Stations were set up in Czechoslovakia prior to the launching of the first Soviet satellite: as early as May 1957, in connection with the International Geophysical Year. AT-1 telescopes were sent from the Soviet Union for better observation, and binoculars with large diameters ($D = 80$ mm, magnification 10x, and $D = 100$ mm, magnification 25x) were also used. Good results were also obtained with a Wilde T-2 theodolite. Photographic observations were begun in 1957 with small cameras ($f = 20$ cm). During the International Geophysical Year,

Card 1/3

L 29524-65

ACCESSION NR: AT5003493

5

observations were made chiefly in Prague, Brno, and Bratislava. Visual observations at the Prague station have been under the direction of A. Vratnik. Observation time for both visual and photographic observation is made by means of a device originally developed by R. Raykhel for observing the covered sun. It has a precision of +0.02 second. The principal clocks (Rifler No. 445) are compared with radio signals. Quartz clocks were introduced in 1958. Photographic observations have been made with a camera having a Gekistar objective ($D/f = 1:3.5, f = 15$ cm). Measurements are made with a Zeiss coordinate measuring instrument. Computations on satellite are made at the Institute of Mathematical Machines of the Academy of Sciences. The Brno station, at the Astronomical Institute of the University, is under the direction of B. Onderlichka. Both visual and photographic observations are made. For the photographic work a Zeiss camera is generally used ($D/f = 1:3.5, f = 250$ mm), but others are also used, including an AKP aerial camera ($D/f = 1:5, f = 500$ mm), with a high-speed shutter. The Bratislav station is at the Astronomical Institute of the Slovakian Academy of Sciences. Observations are visual and do not have great precision. A table is furnished to indicate the number of observations made at the various Czechoslovakian stations on the various satellites and rockets. Orig. art. has: 1 table.

TITLE: Work on observations of artificial satellites during 1963 in Czechoslovakia

SOURCE: Nablyudenija iskusstvennykh sputnikov Zemli, no. 2, 1963. Warsaw, PAN,
1963, 142

TOPIC TAGS: satellite observation, artificial earth satellite

ABSTRACT: Observations of artificial satellites in Czechoslovakia were principally visual during 1963 as in previous years. The most active station was Skalnate Pleso (No. 1142). Photographic work was done only at Praha-Petrzin (station No. 1145). Nearly 140 photographs were made of the satellite Echo-I, of which 88 were in the synchronous observation program. Further development of photographic observations of satellites will be directed by the Geodesic Research Institute. Under this program four stations will be built, the main one being at Peany, 300 m from the Ondrzemov Observatory. The principal goal of these stations will be the utilization of synchronous satellite observations in geodesy.

TITLE: Problems of Railroad Electrification. (Voprosy
elektrifikatsii zheleznykh dorog, Russian)
PERIODICAL: Elektrichestvo, 1957, Nr 8, pp 72 - 74 (U.S.S.R.)

ABSTRACT: By 1960 5000 km of the U.S.S.R. railroad lines will be electrified with direct current. Therefore all endeavors have to be made to solve the problems which are connected with the selection of optimum parameters of the new system of electric traction in the case of a monophase current with industrial frequency, and to bring about an improvement and an increase in the efficiency of the direct-current systems. The following items are pointed out: very important is the use of transformers with a voltage control and with load in the substations, the increase of the voltage level in the contact network, the necessity to take into account the voltage variations in the feeding energy systems on calculations of the electrotraction networks, the degree of compensation of the induction resistance exerts a very special influence on the transmitting power of the contact network, compensation devices or a longitudinal compensation have to be used in the substations.

AUTHOR: Sekhposyan, E. V., and Ter-Mikayelyan, M. L.

TITLE: Angular distribution and polarization of bremsstrahlung

PERIODICAL: Akademiya nauk Armyanskoy SSR. Izvestiya. Seriya fiziko-matematicheskikh nauk, v. 14, no.4, 1961, 143-154

TEXT: The angular distribution, pair creation in the crystal, and the polarization of bremsstrahlung are investigated by the method of Weizsäcker-Williams. Calculation of the bremsstrahlung cross-section reduces to multiplying the Kleyn-Nishina formula by the total number of pseudophotons and to passing to a system of coordinates, in which the crystal is at rest. Angular distribution of quanta: The differential cross-section for bremsstrahlung in the crystal can be expressed by

Card 1/8

X

Angular distribution and ...

30395
S/022/61/014/004/009/010
D299/D302

$$\begin{aligned}
 d\sigma = & \frac{4r_0^2 Z^2}{137\pi} \frac{d\varepsilon}{\varepsilon} x dx \left[\frac{\varepsilon_1^2 + \varepsilon_2^2}{(1+x^2)\varepsilon_1^2} - \frac{4x^2 \varepsilon_2}{\varepsilon_1^2 (1+x^2)^4} \right] \times \\
 & \times \int \frac{(k_2^2 + k_3^2) dk_2 dk_3}{(k^2 + 1/R^2)^2} \left| \sum_i e^{i \vec{k} \cdot \vec{r}_i} \right|^2
 \end{aligned} \tag{1.2}$$

where $R = R_0 Z^{-1/3}$, R_0 is the Bohr radius, r_0 - the classical electron-radius, \vec{r}_i - the lattice coordinates, k - the momenta imparted to the nuclei, ε - the energy of the emitted quantum, ε_1 - the energy of the incident electron, ε_2 - the energy of the secondary electron. The last factor on Eq. (1.2) can be approximated by

Card 2/ 8

Angular distribution and ...

³⁸³⁹⁵
 S/022/61/014/004/009/010
 D299/D302

$$\left| \sum_i e^{i \vec{k} \cdot \vec{r}_i} \right|^2 = \left(1 - e^{-k^2 \bar{u}^2} \right) N + e^{-k^2 \bar{u}^2} \left| \sum_i e^{i \vec{k} \cdot \vec{r}_{i0}} \right|^2 \quad (1.3)$$

where \bar{u}^2 is the mean square of the thermal fluctuations of the lattice atoms, N - the number of atoms per unit volume. Depending on the number of terms in (1.3), the cross-section for bremsstrahlung and pair creation will consist of 3 components: $d\sigma = d\sigma_1 + d\sigma_2 + d\sigma_u$, where $d\sigma_1$ corresponds to the cross-section when the crystalline structure is ignored (the Bethe-Heitler formula), $d\sigma_2$ is a correction term due to thermal fluctuations, and $d\sigma_u$ is the interference cross-section which is largely dependent on the angle θ of the incident electron. The latter term is expressed by

Card 3/8

30395
S/022/61/014/004/009/010
D299/D302

Angular distribution and ...

$$\begin{aligned}
 d\sigma_u = & \frac{4r_0^2 Z^2 d\varepsilon}{137\pi \varepsilon} x dx \left| \frac{\varepsilon_1^2 + \varepsilon_2^2}{\varepsilon_1^2(1+x^2)^2} - \frac{4x^2 \varepsilon_2}{\varepsilon_1(1+x^2)^4} \right| \times \\
 & \times \int \frac{(k_x^2 + k_y^2) e^{-\mu u^2} dk_x dk_y}{(k^2 + 1/R^2)^2} N \frac{8\pi^3}{b f d} \sum_{lmn} \delta\left(k_x - \frac{2\pi}{b} l\right) \times \\
 & \times \delta\left(k_y - \frac{2\pi}{f} m\right) \delta\left(k_z - \frac{2\pi}{d} n\right). \tag{1.5}
 \end{aligned}$$

After transformations, a simpler formula is obtained, and the integral it contains is calculated. Other formulas are obtained for $d\sigma_1$ and $d\sigma_2$. Comparing the three formulas for the components of $d\sigma$, the conclusion is reached that with sufficiently small angles θ , the main contribution to the bremsstrahlung is made by the interference term. with angles $\theta < \sqrt{u^2} \propto \delta(1+x^2)$, the interference radiation is exponentially small. With $u^2 \rightarrow \infty$, only the amorphous term

Card 4/8

30395

S/022/61/014/004/009/010
D299/D302

Angular distribution and ...

$d\sigma'$ is retained. Pair creation: As the matrix element for pair creation coincides with the matrix element for bremsstrahlung, the derivation of the pertinent formulas reduces to changing the density of the finite states, i.e multiplication by $\frac{\varepsilon_2 d\varepsilon}{\varepsilon_2^2 d\varepsilon}$ and redefinition of variables: $\varepsilon_1 \rightarrow \varepsilon_-$, and $\varepsilon_2 \rightarrow \varepsilon_+$ (ε_- is the energy of the electron, and ε_+ - of the positron). The conclusions of the foregoing section apply to pair creation as well. Polarization: After taking the average with respect to the polarization of the incident pseudophoton, one obtains

$$d\varphi = \frac{1}{4} r_0^2 d\Omega \frac{v'^2}{v^2} \left[\frac{v}{v'} + \frac{v'}{v} - 2 \cos^2 \xi \sin^2 \theta \right] \quad (3.2)$$

where θ is the scattering angle, ξ is the angle between the plane of polarization of the scattered pseudophoton and the plane ($\vec{n}' \vec{n}$), \vec{n}

Card 5/8

Angular distribution and ...

30395
 S/022/61/014/004/009/010
 D299/D302

- is the direction of the incident pseudophoton and \vec{n}' - of the scattered one. Calculation of the cross-section reduces to multiplying formula (3.2) by the corresponding formula for the number of quanta and passing to a system, in which the nucleus (or crystal) is at rest. The final formulas for a single atom are

$$d\sigma = 4x dx \frac{z^2 r_0^2}{137} \frac{d\varepsilon}{\varepsilon} \left[\frac{1}{2} \frac{\varepsilon_1^2 + \varepsilon_2^2}{\varepsilon_1^2 (1+x^2)^2} \right] \int \frac{k_\perp^2 dk_\perp^2}{\left(k_\perp^2 + k_{11}^2 + \frac{1}{R^2} \right)^2} \quad (3.3)$$

$$d\sigma_{11} = 4x dx \frac{z^2 r_0^2}{137} \frac{d\varepsilon}{\varepsilon} \left[\frac{1}{2} \frac{\varepsilon_1^2 + \varepsilon_2^2}{\varepsilon_1^2 (1+x^2)^2} - \frac{4x^2 \varepsilon_2}{\varepsilon_1 (1+x^2)^4} \right] \int \frac{k_\perp^2 dk_\perp^2}{\left(k_\perp^2 + k_{11}^2 + \frac{1}{R^2} \right)^2} \quad (3.4)$$

Card 6/8

30395

S/022/61/014/004/009/010
D299/D302

Angular distribution and ...

where $d\sigma_{\perp}$ corresponds to $\xi = 90^\circ$, and $d\sigma_{11}$ - to $\xi = 0^\circ$. A comparison of the above results with formulas of the perturbation theory shows that the Weizsäcker-Williams method leads to accurate results for angles θ , for which the main contribution to the bremsstrahlung is made by the interference term. With angles θ , for which the amorphous term is significant too, the above method leads to a large error in the polarization, whereas the error in calculating the total cross-section is logarithmical only. There are 1 figure and 5 references: 1 Soviet-bloc and 4 non-Soviet-bloc. The references to the English-language publications read as follows: I. I. A micromethod of the well-known polarographic cancer test of Brdička was developed. 0.05 ml. blood taken from the tail vein of a rat was immediately denatured in 1 ml. 0.1 N-NaOH for 45 minutes at room temperature. Thereafter 1 ml. 5% sulphosalicylic acid was added and the mixture shaken vigorously. After exactly 10 minutes the fluid was centrifuged for 5 minutes, and 1 ml. was pipetted and polarographed in open vessels with 2 ml. of a solution consisting of 0.0015 M-Co⁺⁺, 0.1 N-NH₄Cl, 1 N-NH₄OH. Centrifugation has the advantage of avoiding the adsorption of active substances on the filter paper or glass filter which is apt to occur with the usual methods of filtration.

Title : Resistance of Rats to Tumor Implantation and to Development of a Neoplasm Produced by a Chemical Carcinogen.

Orig Pub : Univ. carolina. Med., 1955, Suppl. No 1, 194-202

Abstract : Hybrid rats in which Walker tumor 256 does not take are relatively resistant also to the carcinogenic action of 3,4 -benzpyrene: subcutaneous tumors were developed by them more slowly than by a line susceptible to Whister.

*Passive transfer of a tumour-resistant agent by serum
injections NATURE (Lond.) 1956, 187/4531 (497) Tables 2

In two independent experiments marked growth inhibition of the Walker 256 tumour was attained in susceptible (Wistar) rats by intraperitoneal injections of 'immune resistant serum' (taken from rats of a resistant strain after regression of the first implant of the same tumour and several further unsuccessful implantations). The same treatment with normal sera from rats of susceptible or resistant strains was without effect. It is concluded that rats of the resistant strain are capable, when implanted with the tumour, of developing a high degree of specific antibody formation, and that these antibodies can be passively transferred by injection of their blood serum.
